Reading package lists... Done
 ubuntu@ubuntu−vm:~$
```

#### Puis on upgrade

```
اo user sessions are running outdated binaries.
اo VM guests are running outdated hypervisor (qemu) binaries on this host.
ubuntu@ubuntu–vm:~$ sudo apt–get upgrade_
```

### 2- Installation de PHP et Apache

On installe PHP et Apache

```
ubuntu@ubuntu–vm:~$ sudo apt–get install apache2 php libapache2–mod–php
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
php is already the newest version (2:8.1+92ubuntu1).
php set to manually installed.
apache2 is already the newest version (2.4.52–1ubuntu4.8).
apache2 set to manually installed.
ubuntu@ubuntu–vm:~$ sudo apt–get install php–imap php–ldap php–curl php–xmlrpc php–gd php–mysql php–
Reading package lists... Done
Building dependency tree... Done
The following additional packages will be installed:

The following packages were automatically installed and are no longer required:

libflashrom1 libftdi1-2

Use 'sudo apt autoremove' to remove them.

The following additional packages will be installed:
  apache2 apache2-bin apache2-data apache2-utils bzip2 fontconfig-config fonts-dejavu-core
libapache2-mod-php8.1 libapr1 libaprutil1 libaprutil1-dbd-sqlite3 libaprutil1-ldap
  libc–client2007e libdeflate0 libfontconfig1 libgd3 libjbig0 libjpeg–turbo8 libjpeg8 liblua5.3–0
  libtiff5 libwebp7 libxmlrpc-epi0 libxpm4 mailcap mime-support mlock php php-common php8.1 php8.1-cli php8.1-common php8.1-curl php8.1-gd php8.1-ldap php8.1-ldap php8.1-mysql
  php8.1-opcache php8.1-phpdbg php8.1-readline php8.1-xmlrpc ssl-cert
 Suggested packages:
  apache2-doc apache2-suexec-pristine | apache2-suexec-custom www-browser bzip2-doc php-pear
  uw-mailutils libgd-tools
```

#### 3- Installation de la base de données pour GLPI

#### On installe la base de données,

```
ubuntu@ubuntu-vm:~$ sudo apt-get install mariadb-server
Reading package lists... Done
Building dependency tree... Done
Readding state information... Done
The following packages were automatically installed and are no longer required:
   libflashrom1 libftdi1-2
Use 'sudo apt autoremove' to remove them.
The following additional packages will be installed:
   galera-4 libcgi-fast-perl libcgi-pm-perl libclone-perl libconfig-inifiles-perl libfcgioldb1
   libbtml-parser-perl libdbi-perl libencode-locale-perl libfcgi-bin libfcgi-perl libfcgioldb1
   libhtml-parser-perl libhtml-tagset-perl libhtml-template-perl libhttp-date-perl
   libhttp-message-perl libio-html-perl liblwp-mediatypes-perl libmariadb3 libmysqlclient21
   libndct16 libpmem1 libsnappy1v5 libtimedate-perl liburi-perl liburing2 mariadb-client-10.6
   mariadb-client-core-10.6 mariadb-common mariadb-server-10.6 mariadb-server-core-10.6
   mysql-common socat
Suggested packages:
   libmldbm-perl libnet-daemon-perl libsql-statement-perl libdata-dump-perl libipc-sharedcache-libbusiness-isbn-perl libwww-perl mailx mariadb-test
The following NEW packages will be installed:
   galera-4 libcgi-fast-perl libcgi-pm-perl libclone-perl libcconfig-inifiles-perl libfcgioldb1
   libbtal accept perl libfcgi-perl libfcgi-perl libfcgi-perl libfcgi-perl libfcgioldb1
   libtal accept perl libcdoi-perl libctal-perl libfcgi-perl libfcgioldb1
```

```
ubuntu@ubuntu–vm:~$ sudo mysql_secure_installation

NOTE: RUNNING ALL PARTS OF THIS SCRIPT IS RECOMMENDED FOR ALL MariaDB
SERVERS IN PRODUCTION USE! PLEASE READ EACH STEP CAREFULLY!

In order to log into MariaDB to secure it, we'll need the current password for the root user. If you've just installed MariaDB, and haven't set the root password yet, you should just press enter here.

Enter current password for root (enter for none):
```

Puis il nous sera demandé de définir un mot de passe. Nous mettons "glpi".

```
You already have your root account protected, so you can safely answer 'n'
Change the root password? [Y/n] y
New password:
Re–enter new password: _
```

#### 4- Démarrage du serveur Apache

Nous allons maintenant mettre en marche le serveur Apache.

```
ubuntu@ubuntu–vm:~$ sudo apt–get install apcupsd php–apcu
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following packages were automatically installed and are no longer requir
libflashrom1 libftdi1–2
Use 'sudo apt autoremove' to remove them.
The following additional packages will be installed:
```

ubuntu@ubuntu–vm:~\$ sudo /etc/init.d/apache2 restart Restarting apache2 (via systemctl): apache2.service.

On vérifie que la redirection des ports est bien configurée sur VirtualBox.

# 5- Configuration de GLPI

Une page d'installation s'affiche. Nous allons procéder à la configuration de GLPI.

#### On installe

Une page affichera des fichiers manquants. Nous allons donc les installer.

#### On installe les fichiers requis.

```
ubuntu@ubuntu–vm:/usr/src$ sudo apt–get install php–intl
Reading package lists... Done
Building dependency tree... Done
Reading state information... Done
The following packages were automatically installed and are no longer required:
libflashrom1 libftdi1–2
Use 'sudo apt autoremove' to remove them.
The following additional packages will be installed:
 php8.1–intl
The following NEW packages will be installed:
php–intl php8.1–intl
O upgraded, 2 newly installed, O to remove and 7 not upgraded.
Need to get 144 kB of archives.
After this operation, 522 kB of additional disk space will <u>be used.</u>
Do you want to continue? [Y/n]
ubuntu@ubuntu–vm:/usr/src$ sudo apt–get install php–dom
ubuntu@ubuntu–vm:/usr/src$ sudo apt–get install php–simplexml
Reading package lists... Done
```

Puis on redémarre Apache pour appliquer les modifications.

ubuntu@ubuntu–vm:/usr/src\$ sudo service apache2 reload

On rafraîchit la page et on constate que tout est installé.

## 6- Connexion à GLPI

On renseigne les informations demandées.

On sélectionne la base de données créée précédemment.

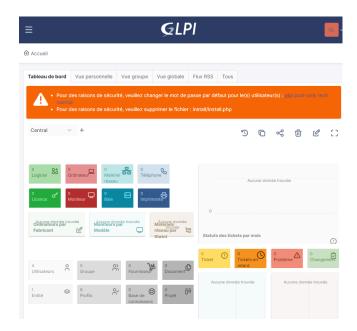

La configuration de GLPI est terminée.

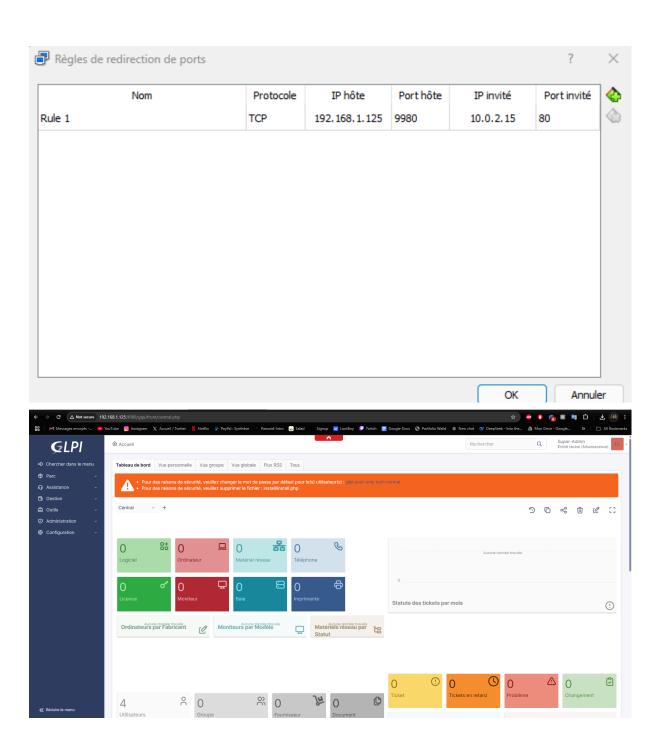

On se connecte avec les identifiants.

## GLPI est enfin installé

# 7- Connexion de deux machines physiques

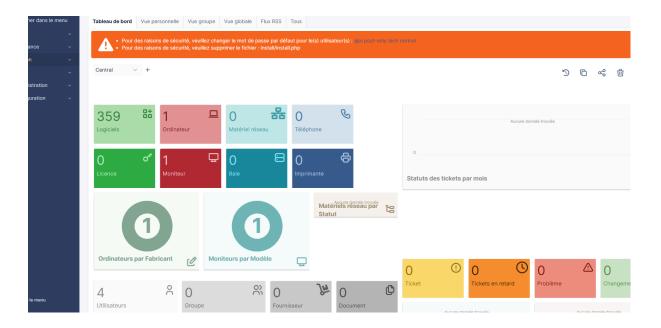

Nous configurons l'agent pour la première machine, puis nous effectuons la même opération pour la deuxième machine.

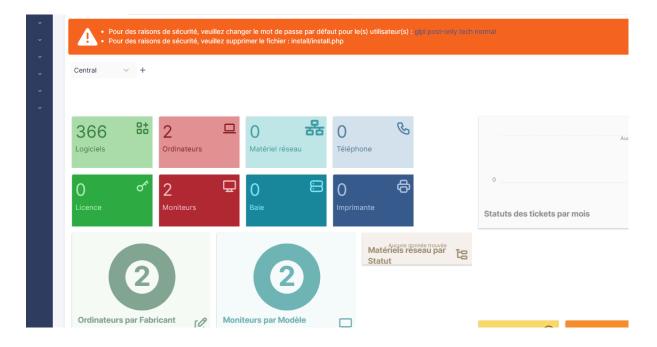

```

1ere machine

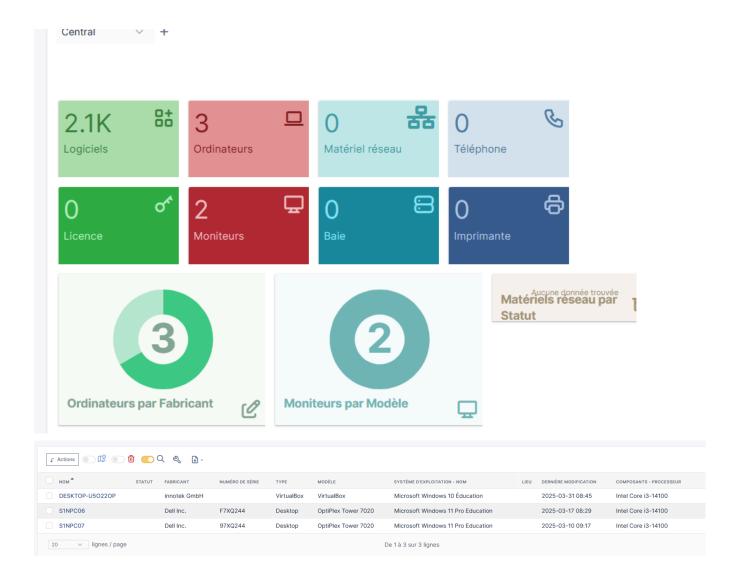

#### 2eme machine

## 8- Recensement d'une machine Ubuntu

#### 3eme machine

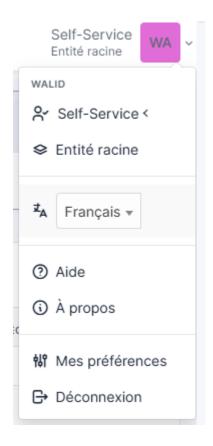

## 9- Création d'un utilisateur pour la gestion des tickets

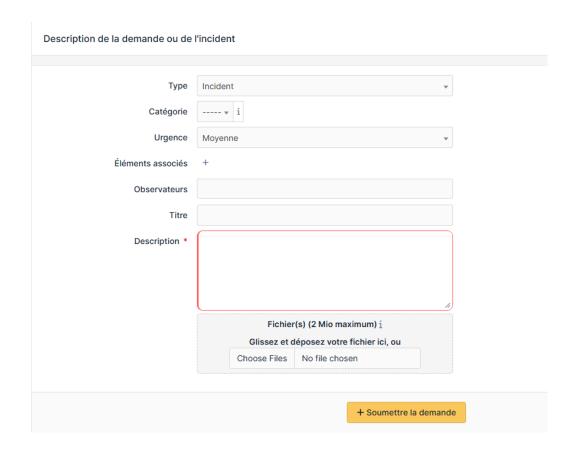

Nous créons un utilisateur afin de pouvoir créer et gérer des tickets.

# On se connecte au compte utilisateur

L'utilisateur (Walid) crée un ticket, on fera de même avec l'autre compte.

## 10- Réception et traitement du ticket

Les tickets sont reçus sur le compte technicien.
